

How IVF Works...

1. Hormone shots stimulate the ovaries
2. Eggs are collected from the ovaries
3. Eggs are fertilized with sperm in a lab
4. Healthy embryo(s) are transferred to the uterus
5. A pregnancy test is done after 12–14 days

IN VITRO FERTILIZATION (IVF)

What is IVF?

IVF is a fertility treatment where eggs are retrieved from the ovaries, fertilized with sperm in a lab, and then the best embryo is placed into the uterus to help achieve pregnancy

Why is IVF Used?

- Blocked or damaged fallopian tubes
- Low sperm count or quality
- PCOS or ovulation issues
- Endometriosis
- Age-related fertility decline
